**Algorithm 1:** Adjust solver tolerance

---

**Input:**  $\alpha$ , maximum L2 divergence error,  $\|(Q_T - \nabla \cdot \mathbf{u})_*\|_2 \leq \alpha$ ;  
 $\beta$ , maximum relative increase in L2 divergence error,  
 $\frac{\|(Q_T - \nabla \cdot \mathbf{u})_{\tau_2}\|_2}{\|(Q_T - \nabla \cdot \mathbf{u})_{\tau_1}\|_2} \leq \beta$ ;  
 $\tau_{max}$ , maximum solver tolerance;  
 $\tau_i$ , current solver tolerance;  
 $n_f$ , frequency to adjust tolerance;  
 $\mu > 1$ , solver tolerance multiplier to increase/decrease tolerance by;  
 $n$ , current step;  
**Output:**  $\tau$ , the new solver tolerance;  
Solution state  $(\mathbf{u}, P)$  ;  
**if**  $n \bmod n_f = 0$  **then**  
     $\tau_1 = \tau_i$   
    Run step at  $\tau_1$   
    **if**  $\|(Q_T - \nabla \cdot \mathbf{u})_{\tau_1}\|_2 > \alpha$  **then**  
         $\tau_2 = \frac{\tau_1}{\mu}$   
        Run step at  $\tau_2$   
    **else**  
         $\tau_2 = \min(\mu\tau_1, \tau_{max})$   
        Run step at  $\tau_2$   
        **if**  $\|(Q_T - \nabla \cdot \mathbf{u})_{\tau_2}\|_2 > \alpha$  *or*  $\frac{\|(Q_T - \nabla \cdot \mathbf{u})_{\tau_2}\|_2}{\|(Q_T - \nabla \cdot \mathbf{u})_{\tau_1}\|_2} > \beta$  **then**  
             $\tau_2 = \tau_1$   
            Run step at  $\tau_2$   
    Increment  $n$   
    return  $\tau_2$   
**else**  
    Run step at  $\tau_i$   
  
    // Don't update the solver tolerances  
    Increment  $n$   
    return  $\tau_i$
