

Poisson

- Poisson solve encompasses the majority of the solution time.
- Spectral element (SE): E elements with polynomial degree p , $n \approx Ep^3$ unknowns and $\mathcal{O}(Ep^6)$ nonzeros.
 - Matrix-free is a must: exploit tensor-product-sum factorization, $\mathcal{O}(Ep^4)$ cost to apply matrix-vector product¹.
 - Fast solvers require preconditioning.

¹Deville et al., *High-order methods for incompressible fluid flow*. 

Solvers

- Solution projection for initial guess generation²
- Krylov subspace projection methods:
 - flexible PCG
 - PGMRES
- Preconditioners:
 - Low-order operator preconditioning (SEMFEM)
 - Geometric p -Multigrid (pMG), requiring a smoother:
 - Additive Schwarz (ASM) and restrictive additive Schwarz (RAS)
 - Chebyshev polynomial smoothing
 - Jacobi
 - ASM, RAS

²Fischer, "Projection techniques for iterative solution of $Ax = b$ with successive right-hand sides".

SEM-FEM

- Precondition high-order system using low-order discretizations with coinciding nodes.
- Orszag³ demonstrated $\kappa(M^{-1}A) \sim \pi^2/4$ scaling for second-order Dirichlet problems.
- Bello-Maldonado and Fischer⁴ proposed one-per-vertex scheme.
 - Same, single V-cycle AmgX⁵, damped Jacobi ($\omega = 0.9$).
- Other approaches exist, such as Pazner⁶.

⁴Bello-Maldonado and Fischer, "Scalable Low-Order Finite Element Preconditioners for High-Order Spectral Element Poisson Solvers".

⁵Naumov et al., "AmgX".

⁶Pazner, "Efficient low-order refined preconditioners for high-order matrix-free continuous and discontinuous Galerkin methods"

ASM, RAS Smoothers

- $M^{-1} := \sum_{e=1}^E W_e R_e^T \bar{A}_e^{-1} R_e$, subdomain (a)⁷.
- How to form \bar{A}_e^{-1} ?
 - Galerkin: $\bar{A}_e = R_e A R_e^T$, ruins $\mathcal{O}(p^3)$ storage, $\mathcal{O}(p^4)$ work per element.
 - Box-like approximation (b): recover $\mathcal{O}(p^3)$ storage, $\mathcal{O}(p^4)$ work per element using fast diagonalization method (FDM).

⁷Lottes and Fischer, "Hybrid Multigrid/Schwarz Algorithms for the Spectral Element Method"; Loisel et al., "On Hybrid Multigrid-Schwarz Algorithms".

Chebyshev Smoothing

- Construct Chebyshev polynomial of SA minimum in interval $[\lambda_{min}, \lambda_{max}]$.
- Max eigenvalue estimate $\tilde{\lambda}$ obtained with 10 Arnoldi iterations, $(\lambda_{max}, \lambda_{min}) = (1.1, 0.1)\tilde{\lambda}$.
- $S = \text{invDiag}(A)$ ⁸, or, more recently, a Schwarz smoother⁹
 - Chebyshev-acceleration *robustifies* point wise smoother (Jacobi)
 - Similarly, Chebyshev-acceleration applied to Schwarz smoothers improves multigrid convergence

Navier-Stokes

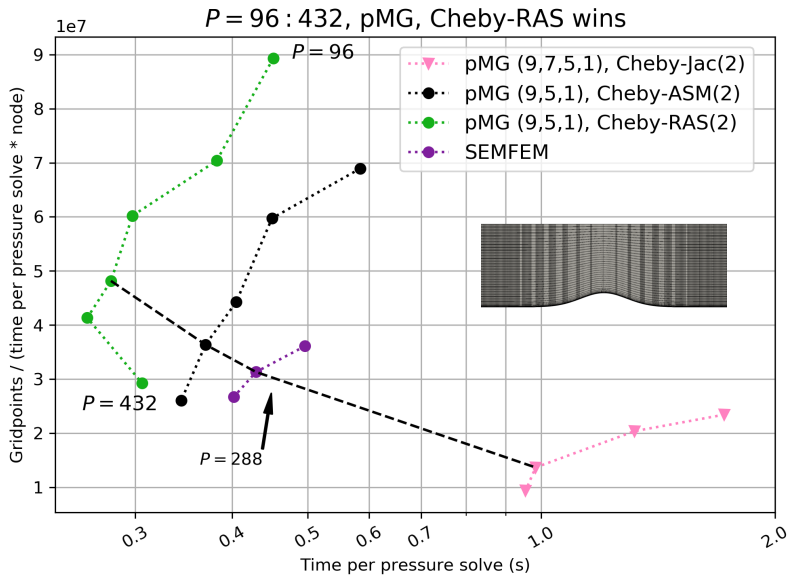

Case Name	E	p	n
146 pebble (a)	62K	7	21M
1568 pebble (b)	524K	7	180M
67 pebble (c)	122K	7	42M
Speed bump (d)	885K	9	645M
	CFL	Δt	$T_{restart}$
(a)	4	2×10^{-3}	10
(b)	4	5×10^{-4}	20
(c)	4	5×10^{-5}	10.6
(d)	0.8	2×10^{-3}	5.6
	Re	Tol	Steps
(a)	5000	10^{-4}	2000
(b)	5000	10^{-4}	2000
(c)	1460	10^{-4}	2000
(d)	10^6	10^{-5}	2000

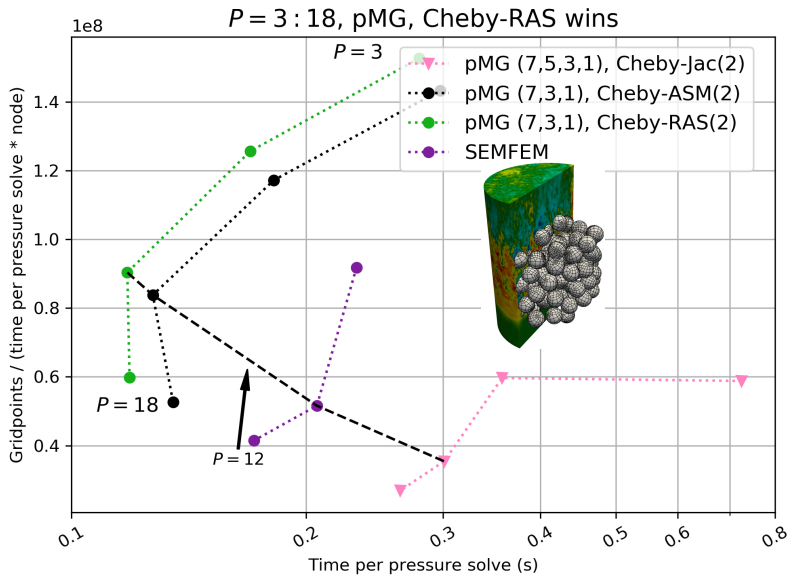

Results

- All results on Summit (42 IBM Power9 CPUs, 6 NVIDIA V100 GPUs per node).
- Each of the P ranks are assigned one GPU, 6 GPUs per node (unless $P < 6$).
- At coarsest level, solve using one BoomerAMG V-cycles¹⁰
- pMG (7,3,1), Cheby-ASM(2) denotes pMG preconditioning with a 2nd-order Chebyshev-accelerated ASM smoother with $p = 7$, $p = 3$, and $p = 1$ as multigrid levels.
